Release Notes 8.0.2 — Appway Component Extension
Patch Release | 31.10.2018

Changes since version 8.0.1 of the Component Extension.

Adaptive Flow Layout

- Bugfix: Fixed an issue that caused Adaptive Flow Layout Element components containing InfoBox(es) to overlap when rendered for the first time in IE11.

Adaptive Tab

- Bugfix: Fixed a JavaScript error in the Adaptive Tab Screen Component. As a result, Screen Components such as the Adaptive Flow Layout or Navigation Menu are displayed properly in the SpaceScreen template provided by the Design System.
- Bugfix: Restored the functionality of the component that remembers the active tab after a page was submitted (using an implicit binding of the selected tab).

Dropdown List

- Bugfix: The component is now searchable and not disabled when there is a filter variable assigned to the 'Catalog' data source, even if there are no options defined initially.

Style Business Objects

- Bugfix: For new installations, the 'Heading1-small' default Style Business Object now inherits from 'Heading1', with the Text Size adjusted to 'TextSizeXL'. If you are upgrading to 8.0.2 from a 7.2.x installation, the style inheritance in place when you first installed is persisted, therefore you need to change it manually, if necessary.
- Bugfix: For new installations, the 'Heading2-small' default Style Business Object now inherits from 'Heading2', with the Text Size adjusted to 'TextSizeM'. If you are upgrading to 8.0.2 from a 7.2.x installation, the style inheritance in place when you first installed is persisted, therefore you need to change it manually, if necessary.
